

5. Making a Field Read-only and Controlling Visibility

UI Policies can also prevent users from changing selected fields after a condition is met.

For this example, Caller is configured as read-only while remaining visible on the form.

The Visible setting can also be changed when a condition is met, allowing fields to be shown or hidden dynamically.

- Read-only = Yes prevents editing through the form.
- Visible = Yes keeps the field displayed.
- A UI Policy Action can be created for each field that requires dynamic behavior.
